Why is this project a best practice?

Challenge

The project addresses the difficulty of scaling low-energy and healthy-building principles beyond a single dwelling. It had to combine density or phased delivery with reliable energy performance, good indoor conditions, landscape quality, mobility and construction cost, while keeping the sustainability measures practical for many future occupants.

Solution

The response combines retention and integration of the façade of a former perfume factory; responsible construction, sustainable materials, energy efficiency and improved biodiversity; and biophilic design, high indoor-air-quality targets, bicycle/alternative transport support and underground parking. These measures were brought together through an integrated design approach and, where applicable, the Green Homes, nZEB or Passive House performance framework.

Replicability

The approach can be scaled through repeatable specifications for envelope, MEP systems, materials, commissioning, mobility and landscape. Replication is strongest when the developer applies the same measurable requirements to every phase and verifies them at handover, rather than treating certification as a one-off design exercise.

Key facts and figures

Location	Strada C. Bosianu 25-29, Bucharest, Romania
Building use / function	Multi-family residential development incorporating industrial heritage

Project type (new build, refurbishment, extension)	Adaptive reuse / new build around retained façade
Plot area / Floor area	Approximately 2,640 m ² ; 44 apartments
Year / phase	Completed / final certification reported in 2020
Climate zone	Temperate continental
Thematic focus / innovation	Heritage reuse; energy efficiency; biodiversity; indoor air quality; biophilic design; sustainable mobility
Investor / building owner	Kingsmen Estate / CNO (public sources differ by project phase)
Architect	Not publicly disclosed in the consulted sources
Other involved stakeholders	Romania Green Building Council; heritage, landscape and construction teams
Contact person	Developer / RoGBC

Gramont Neighborhood is a adaptive reuse / new build around retained façade project in Strada C. Bosianu 25-29, Bucharest, Romania. It functions as multi-family residential development incorporating industrial heritage. Its main best-practice contribution is Shows how industrial heritage can become a low-impact identity asset rather than being demolished during residential redevelopment. The documented strategy brings together retention and integration of the façade of a former perfume factory, responsible construction, sustainable materials, energy efficiency and improved biodiversity, and biophilic design, high indoor-air-quality targets, bicycle/alternative transport support and underground parking. Developer naming differs between registry and toolkit; the current project page reports 44 apartments and 2,640 m². Public-source research was reviewed in July 2026; data that vary by phase are explicitly flagged in this sheet.

What was done differently?

1. Performance concept - Retention and integration of the façade of a former perfume factory.
2. Integrated systems and operation - Responsible construction, sustainable materials, energy efficiency and improved biodiversity.
3. Wider value - Biophilic design, high indoor-air-quality targets, bicycle/alternative transport support and underground parking.

What was achieved?

Impact

Environmental impact: The project reduces energy and associated emissions primarily by lowering demand and then using efficient or renewable systems. Its material, landscape, waste or mobility measures add benefits beyond operational energy where documented. A verified whole-life carbon assessment was not publicly available, so the impact is described qualitatively unless a source provides a specific figure.

Economic impact: Lower energy demand can reduce utility exposure and improve long-term operating-cost predictability. Standardised high-performance specifications and third-party certification can also support quality assurance, market value and access to green-finance products. Public sources do not provide a complete investment, payback or life-cycle-cost analysis for this project.

Social impact: The main social benefits are stable indoor temperatures, better air quality, daylight and acoustic comfort, together with safer and more attractive shared or outdoor spaces where these form part of the project. The project also raises market awareness by making high-performance housing visible to residents, designers, contractors and investors.

Key Learnings

Success factors: Key success factors are an integrated design process, a clear performance framework, early coordination of envelope and building services, selection of competent suppliers, quality control during construction and commissioning. Transparent documentation and communication with occupants are essential to preserve the intended performance in use.

Lessons for replication: Replication should start with an energy and comfort target, not a catalogue of technologies. Design teams should verify thermal bridges, airtightness, ventilation, controls and renewable sizing together; record assumptions by project phase; commission systems; and monitor early operation. Where public figures differ by phase, the final as-built dataset must become the single source of truth.
