

ONE HERĂSTRĂU PARK

Why is this project a best practice?

Challenge

The project addresses the difficulty of scaling low-energy and healthy-building principles beyond a single dwelling. It had to combine density or phased delivery with reliable energy performance, good indoor conditions, landscape quality, mobility and construction cost, while keeping the sustainability measures practical for many future occupants.

Solution

The response combines two residential towers providing density close to Herăstrău Park, lakes and public transport; construction-waste reduction and household waste-separation strategies embedded in project delivery; and energy-efficiency measures combined with occupant information to improve performance during use. These measures were brought together through an integrated design approach and, where applicable, the Green Homes, nZEB or Passive House performance framework.

Replicability

The approach can be scaled through repeatable specifications for envelope, MEP systems, materials, commissioning, mobility and landscape. Replication is strongest when the developer applies the same measurable requirements to every phase and verifies them at handover, rather than treating certification as a one-off design exercise.

Key facts and figures

Location	Strada Nicolae G. Caramfil 12-14, Bucharest, Romania
Building use / function	High-rise multi-family residential development

Project type (new build, refurbishment, extension)	New build
Plot area / Floor area	Approximately 8,480 m ² usable; 106 apartments; total built area reported around 28,000 m ²
Year / phase	Completed / final certification in 2017
Climate zone	Temperate continental
Thematic focus / innovation	Green-certified high-rise housing; construction-waste management; household waste separation; efficient systems; occupant education
Investor / building owner	One United Properties
Architect	Not publicly disclosed in the consulted sources
Other involved stakeholders	Romania Green Building Council; specialist façade, MEP and waste-management teams
Contact person	One United Properties - https://www.one.ro/
Further information	https://green-homes.org/property/one-herastrau-park/ https://www.rogbc.org/proiecte-certificate-ro gbc?lang=en https://www.rogbc.org/_files/ugd/40ee3e_b5d91d7a3b71422cb98cd7a289b89c79.pdf

One Herăstrău Park is a new build project in Strada Nicolae G. Caramfil 12-14, Bucharest, Romania. It functions as high-rise multi-family residential development. Its main best-practice contribution is An early large One United project that linked certified high-rise housing with both technical and behavioural measures. The documented strategy brings together two residential towers providing density close to Herăstrău Park, lakes and public transport, construction-waste reduction and household waste-separation strategies embedded in project delivery, and energy-efficiency measures combined with occupant information to improve performance during use. Public sources consistently report 106 apartments and 2017 completion; detailed measured post-occupancy data are not public. Public-source research was reviewed in July 2026; data that vary by phase are explicitly flagged in this sheet.

What was done differently?

1. Performance concept - Two residential towers providing density close to herăstrău park, lakes and public transport.
2. Integrated systems and operation - Construction-waste reduction and household waste-separation strategies embedded in project delivery.
3. Wider value - Energy-efficiency measures combined with occupant information to improve performance during use.

What was achieved?

Impact

Environmental impact: The project reduces energy and associated emissions primarily by lowering demand and then using efficient or renewable systems. Its material, landscape, waste or mobility measures add benefits beyond operational energy where documented. A verified whole-life carbon assessment was not publicly available, so the impact is described qualitatively unless a source provides a specific figure.

Economic impact: Lower energy demand can reduce utility exposure and improve long-term operating-cost predictability. Standardised high-performance specifications and third-party certification can also support quality assurance, market value and access to green-finance products. Public sources do not provide a complete investment, payback or life-cycle-cost analysis for this project.

Social impact: The main social benefits are stable indoor temperatures, better air quality, daylight and acoustic comfort, together with safer and more attractive shared or outdoor spaces where these form part of the project. The project also raises market awareness by making high-performance housing visible to residents, designers, contractors and investors.

Key Learnings

Success factors: Key success factors are an integrated design process, a clear performance framework, early coordination of envelope and building services, selection of competent suppliers, quality control during construction and commissioning. Transparent documentation and communication with occupants are essential to preserve the intended performance in use.

Lessons for replication: Replication should start with an energy and comfort target, not a catalogue of technologies. Design teams should verify thermal bridges, airtightness, ventilation, controls and renewable sizing together; record assumptions by project phase; commission systems; and monitor early operation. Where public figures differ by phase, the final as-built dataset must become the single source of truth.
