

VISION

Why is this project a best practice?

Challenge

The project addresses the difficulty of scaling low-energy and healthy-building principles beyond a single dwelling. It had to combine density or phased delivery with reliable energy performance, good indoor conditions, landscape quality, mobility and construction cost, while keeping the sustainability measures practical for many future occupants.

Solution

The response combines two residential phases totalling 177 apartments in a well-connected Cluj location; Green Homes criteria used for energy, materials, indoor quality and construction management; and a compact building form and proximity to services that reduce resource use per dwelling. These measures were brought together through an integrated design approach and, where applicable, the Green Homes, nZEB or Passive House performance framework.

Replicability

The approach can be scaled through repeatable specifications for envelope, MEP systems, materials, commissioning, mobility and landscape. Replication is strongest when the developer applies the same measurable requirements to every phase and verifies them at handover, rather than treating certification as a one-off design exercise.

Key facts and figures

Location	Strada Răsăritului 73, Cluj-Napoca, Romania
Building use / function	Multi-family residential development

Project type (new build, refurbishment, extension)	New build; two phases
Plot area / Floor area	Approximately 10,620 m ² ; 177 apartments
Year / phase	Completed / final certification reported in 2014
Climate zone	Humid continental
Thematic focus / innovation	Early Green Homes multi-family housing; efficient envelope and systems; healthy materials; urban connectivity
Investor / building owner	Studium Green
Architect	Not publicly disclosed in the consulted sources
Other involved stakeholders	Romania Green Building Council; local design and construction partners
Contact person	Studium Green - https://studiumgreen.ro/
Further information	https://green-homes.org/property/vision/ https://www.rogbc.org/proiecte-certificate-rodbc?lang=en https://www.rogbc.org/_files/ugd/40ee3e_b5d91d7a3b71422cb98cd7a289b89c79.pdf

Vision is a new build; two phases project in Strada Răsăritului 73, Cluj-Napoca, Romania. It functions as multi-family residential development. Its main best-practice contribution is One of the early large Green Homes examples developed by Studium Green in Cluj-Napoca. The documented strategy brings together two residential phases totalling 177 apartments in a well-connected Cluj location, Green Homes criteria used for energy, materials, indoor quality and construction management, and a compact building form and proximity to services that reduce resource use per dwelling. The public project page provides area, unit count and certification year but limited technical detail; specific systems should be confirmed from as-built records. Public-source research was reviewed in July 2026; data that vary by phase are explicitly flagged in this sheet.

What was done differently?

1. Performance concept - Two residential phases totalling 177 apartments in a well-connected cluj location.
2. Integrated systems and operation - Green homes criteria used for energy, materials, indoor quality and construction management.
3. Wider value - A compact building form and proximity to services that reduce resource use per dwelling.

What was achieved?

Impact

Environmental impact: The project reduces energy and associated emissions primarily by lowering demand and then using efficient or renewable systems. Its material, landscape, waste or mobility measures add benefits beyond operational energy where documented. A verified whole-life carbon assessment was not publicly available, so the impact is described qualitatively unless a source provides a specific figure.

Economic impact: Lower energy demand can reduce utility exposure and improve long-term operating-cost predictability. Standardised high-performance specifications and third-party certification can also support quality assurance, market value and access to green-finance products. Public sources do not provide a complete investment, payback or life-cycle-cost analysis for this project.

Social impact: The main social benefits are stable indoor temperatures, better air quality, daylight and acoustic comfort, together with safer and more attractive shared or outdoor spaces where these form part of the project. The project also raises market awareness by making high-performance housing visible to residents, designers, contractors and investors.

Key Learnings

Success factors: Key success factors are an integrated design process, a clear performance framework, early coordination of envelope and building services, selection of competent suppliers, quality control during construction and commissioning. Transparent documentation and communication with occupants are essential to preserve the intended performance in use.

Lessons for replication: Replication should start with an energy and comfort target, not a catalogue of technologies. Design teams should verify thermal bridges, airtightness, ventilation, controls and renewable sizing together; record assumptions by project phase; commission systems; and monitor early operation. Where public figures differ by phase, the final as-built dataset must become the single source of truth.
